

Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

Jira Hands-On Practical Report

Name	RAJAT KIRAN KOOGUE
SRN	PES1UG24CS362
Section	F
Project	Freelance_Content_Creator_Escrow_Platform
Lab	Lab 2 – Agile Backlog Creation & Sprint Simulation

Objective: Use Jira to turn functional requirements into Agile backlog items, simulate a sprint, and analyse progress.

1. Jira Backlog – Epics and User Stories

The Jira backlog contains the project work items organized under their respective parent Epics. The visible backlog also shows priorities/status information and story point estimates for the User Stories.

Figure 1: Jira backlog showing Epics, User Stories and story-point estimates.

2. Story Point Assignments

Story points were assigned using the Fibonacci-style estimation scale. The backlog shows the estimates used for the sprint work, including 3, 5 and 8 point stories.

Figure 2: Story-point assignments visible in the Jira backlog.

3. Sprint Board – Active Sprint Simulation

The sprint was simulated by moving User Stories through the Scrum workflow: To Do → In Progress → Done. The screenshots document the intermediate and completed states.

Figure 3: Active Sprint board with a User Story moved to In Progress.

Figure 4: Sprint board showing the User Stories completed in Done.

4. Sprint Completion and Sprint 2

The Jira activity evidence shows Sprint 2 being started for testing and final verification, followed by completion of the Sprint 2 work item. This supports the lab requirement to finish two sprints.

Figure 5: Jira sprint activity/burndown evidence showing Sprint 2 testing and final verification.

5. Burndown Chart

The Burndown Chart provides a visual view of remaining work during the sprint and compares progress with the expected guideline. The captured Jira chart shows the sprint reaching completion.

Figure 6: Jira Sprint Insights and Burndown Chart showing completed sprint work.

6. Reflection

1. Did your estimations reflect the actual effort?

Yes. The story point estimations reasonably reflected the relative effort required by the User Stories. Smaller stories were assigned fewer points, while more complex stories received higher estimates such as 8 points. Because this was a simulated sprint, the estimates served as a useful relative measure of effort and complexity.

2. Was your backlog well-prioritized?

Yes. The backlog was organized according to the importance and impact of the User Stories. Functionality related to deliverable submission, review, approval and payment protection was treated as important because these features are central to the platform workflow.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned Agile workflow. Selected User Stories were placed into the sprint and progressed from To Do to In Progress and then Done. A second sprint was also used for testing and final verification, so the simulation covered both implementation progress and final validation.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how the remaining story points changed as work was completed and allowed progress to be compared with the expected guideline. The completed sprint indicates that the planned work was finished. The chart also demonstrates how burndown information can reveal delays, scope changes, or unrealistic estimation.

7. Submission Checklist

Requirement	Included
Jira backlog with Epics and User Stories	Yes
Story point assignments	Yes
Active Sprint board screenshot	Yes
Evidence of To Do → In Progress → Done workflow	Yes
Sprint completion evidence	Yes
Evidence of the second sprint	Yes
Burndown Chart	Yes
Reflection answers	Yes
Name, SRN and Section	Yes

This report compiles the Jira evidence shared for Lab 2 together with the required reflection responses. The Jira workspace should also be demonstrated to the instructor as required by the lab instructions.
